SUBJECT: Grindstone-Lost-Muddy Creek Dam F-20

This report presents the results of field inspection and evaluation of the Grindstone-Lost-Muddy Creek Dam F-20 (MO 11220).

It was prepared under the National Program of Inspection of Non-Federal Dams.

Thir dam has been classified as unsafe, non-emergency by the St. Louis District as a result of the application of the following criteria:

- a. Spillway will not pass 50 percent of the Probable Maximum Flood without overtopping the dam.
 - b. Overtopping of the dam could result in failure of the dam.
- c. Dam failure significantly increases the hazard to loss of life downstream.

PHASE I REPORT NATIONAL DAM SAFETY PROGRAM ASSESSMENT SUMMARY

Name of Dam State Located County Located Stream Date of Inspection

Grindstone-Lost-Muddy Creek Dam F-20 Missouri Daviess County Tributary to Smith Branch June 30, 1980

Grindstone-Lost-Muddy Creek Dam F-20 was inspected by an inter-disciplinary team of engineers from Hoskins-Western-Sonderegger, Inc. The purpose of the inspection was→to make an assessment of the general conditions of the dam with respect to safety, based upon available data and visual inspection, in order to determine if the dam poses hazards to human life or property.

The guidelines used in the assessment were furnished by the Department of the Army, Office of the Chief of Engineers and developed with the help of several Federal and State agencies, professional engineering organizations, and private engineers.

Grindstone-Lost-Muddy Creek Dam F-20 has a height of twenty-seven (27) feet and a storage capacity at the minimum top elevation of the dam of one hundred (100+) acre-feet. In accordance with the guidelines, a small size dam has a height greater than or equal to twenty-five (25) feet but less than forty (40) feet and a storage capacity greater than or equal to fifty (50) acre-feet but less than one thousand (1,000) acre-feet. The size classification is determined by either the storage capacity or height, whichever gives the larger size category. Grindstone-Lost-Muddy Creek Dam F-20 is classified as a small size dam.

In accordance with the guidelines and based on visual observation, the dam is classified as having a high potential for damage and loss of life. Failure would threaten life and property. The estimated damage zone extends approximately two (2) miles downstream of the dam. Within the damage zone are three dwellings, a garage, and a barn.

Our inspection and evaluation indicates that the spillway does not meet the criteria set forth in the recommended guidelines for a small dam having a high hazard potential. Considering the small volume of water impounded and the downstream channel from the dam, one-half of the Probable Maximum Flood is the appropriate spillway design flood. The spillways will not pass the 100-year flood (1% probability flood, a flood having a one percent chance of being exceeded in any year) without overtopping the dam. The spillways will pass 24% of the Probable Maximum Flood without overtopping the dam. The Probable Maximum Flood (PMF) is defined as the flood that may be expected from the most severe combination of critical meteorologic and hydrologic conditions that are reasonably possible in the region.

Based on available data and on the field inspection of the dam, the following remedial measures should be performed under the guidance of a professional engineer experienced in the design and construction of dams:

a. Alternatives.

(1) The emergency spillway size and/or the height of dam should be increased to pass 50% of the Probable Maximum Flood without overtopping.

b. Operating and Maintenance Procedures.

- (1) The vegetative growth around the principal spillway entrance should be removed and the area should be kept clear to prevent a reduction in the principal spillway capacity.
- (2) The willows in the principal spillway outlet channel should be removed and measures taken to prevent their recurrence.
- (3) The dam should be inspected at regular intervals and records of the inspections made a part of the project file on this dam.

PHOTO NO. 1 - OVERVIEW

PHASE I INSPECTION REPORT NATIONAL DAM SAFETY PROGRAM GRINDSTONE-LOST-MUDDY CREEK DAM F-20 - MO 11220 DAVIESS COUNTY, MISSOURI

SECTION 1 - PROJECT INFORMATION

1.1 GENERAL

- a. <u>Authority</u>. The National Dam Inspection Act, Public Law 92-367, authorized the Secretary of the Army through the Corps of Engineers, to initiate a program of safety inspection of dams throughout the United States. Pursuant to the above, the St. Louis District, Corps of Engineers, District Engineer directed that a safety inspection of Grindstone-Lost-Muddy Creek Dam F-20 be made.
- b. Purpose of Inspection. The purpose of the inspection was to make an assessment of the general condition of the dam with respect to safety, based upon available data and visual inspection, in order to determine if the dam poses hazards to human life or property.
- c. Evaluation Criteria. Criteria used to evaluate the dam were furnished by the Department of the Army, Office of the Chief of Engineers, in "Recommended Guidelines for Safety Inspection of Dams", Appendix D to "Report of the Chief of Engineers on the National Program of Inspection of Dams," dated May, 1975, and published by the Department of the Army, Office of the Chief of Engineers.

1.2 DESCRIPTION OF PROJECT

- a. Description of Dam and Appurtenances.
 - (1) The dam is an earthen flood control dam about 725 feet in length and 27 feet in height, with a storage capacity at the minimum top of dam of 100± acre-feet. It is located in the Iowa-Missouri Heavy Till Plain Resource area of the Central Lowlands Physiographic area about 5.5 miles west of Altamont, Missouri.
 - (2) The principal spillway consists of a 30-inch corrugated metal pipe drop inlet (riser) with trash rack and antivortex device and a 24-inch corrugated metal pipe conduit passing through the base of the dam.
 - (3) A vegetated earth emergency spillway is cut through the left abutment.
 - (4) Pertinent physical data are given in paragraph 1.3 below.

- b. <u>Location</u>. The dam is located in the extreme western portion of Daviess County about 5.5 miles west of Altamont. It is located in the SW 1/4, Sec. 30, T59N, R29W as shown on Plate A-1.
- c. Size Classification. Criteria for determining the size classification of dams and impoundments are presented in the guidelines referenced in paragraph 1.1c above. This dam has a height of 27 feet and a storage capacity at the minimum top elevation of the dam of 100 acre-feet. This dam is classified as a small dam. A small dam has a height greater than or equal to 25 feet but less than 40 feet and a storage capacity greater than or equal to fifty acrefeet but less than 1,000 acre-feet. The size classification is determined by either the storage capacity or height, whichever gives the larger size category.
- d. <u>Hazard Classification</u>. Guidelines for determining hazard classification are presented in the same guidelines as referenced in paragraph 1.1c above. Based on referenced guidelines and on visual observation, this dam is in the High Hazard Classification. The estimated damage zone extends about two miles downstream of the dam. Within the damage zone are three dwellings, a garage and a barn at 0.6 miles.
- e. Ownership. The dam is owned by the Grindstone-Lost-Muddy Creek Watershed Subdistrict, P.O. Box 117, Maysville, Missouri 64469. It is on property owned by Mrs. Gertie Lee, c/o Wesley Lee, Jr., Route 1, Box B-146, Weatherby, Missouri 64497.
- f. Purpose of Dam. The dam was constructed for grade stabilization with flood control features under the Watershed Protection Act, P.L. 566.
- g. <u>Design and Construction History</u>. The dam was designed by the Soil Conservation Service (SCS), Columbia, Missouri. It was constructed in 1975 with the SCS providing technical supervision and quality control during construction.
- h. Normal Operating Procedure. There are no controlled outlet facilities for this dam except the 8-inch diameter drawdown pipe.

1.3 PERTINENT DATA

- a. Drainage Area. 162.0 acres (0.253 square miles).
- b. Discharge at Damsite.
 - (1) All discharges at the damsite are through an uncontrolled 30-inch diameter corrugated metal pipe drop inlet (riser) which is connected to a 24-inch diameter corrugated metal pipe conduit and through an uncontrolled, vegetated earth emergency spillway.

- (2) Estimated maximum flood at damsite Mr. Wesley Lee reported that the highest water he had seen was approximately 4 inches over the riser.
- (3) The principal spillway capacity varies from 0 c.f.s. at elevation 56.0 feet to 36 c.f.s. at the crest of the emergency spillway (elevation 58.4 feet) to 45 c.f.s. at the minimum top of dam (elevation 60.2 feet).
- (4) The emergency spillway capacity varies from 0 c.f.s. at its crest elevation 58.4 feet to 265 c.f.s. at elevation 60.2 feet (minimum top of dam).
- (5) Total spillway capacity at the minimum top of dam is $310 \text{ c.f.s.} \pm 100 \text{ c.f.s.}$

c. Elevations (feet-assumed).

- (1) Observed pool 55.4
- (2) Normal pool 56.0
- (3) Spillway crests

Principal - 56.0

Emergency - 58.4

- (4) Maximum experienced pool 56.4 ±
- (5) Top of dam (minimum) 60.2
- d. Reservoir. Length (feet) of pool
 - (1) At principal spillway crest 800 ±
 - (2) At emergency spillway crest 900 ±
 - (3) At top of dam (minimum) 1,000 \pm
- e. Storage (Acre-feet).
 - (1) Observed pool 50 \pm
 - (2) Normal pool 55 <u>+</u>
 - (3) Spillway crests

Principal - 55 +

Emergency - 77 +

- (4) Maximum experienced pool 56 +
- (5) Top of dam (minimum) $\sim 100 +$

f. Reservoir Surface (Acres).

- (1) Observed pool 7.5 +
 - (2) Normal pool -8.3 +
 - (3) Spillway crests

 Principal 8.3 +

 Emergency 10.1 +
 - (4) Maximum experienced pool 11.5 +
 - (5) Top of dam (minimum) 12 +

g. Dam.

- (1) Type Rolled earth fill
- (2) Length 725 feet +
- (3) Height 27 feet +
- (4) Top width 14 feet
- (5) Side slopes.
 - (a) Downstream 1V on 2.5H with 10 foot wide berm
 - (b) Upstream 1V on 2.5H with 10 foot wide berm
- (6) Zoning Homogeneous
- (7) Impervious core Homogeneous
- (8) Cutoff Depth varies from 4 to 8 feet, 12 foot bottom width, 1V on 1H side slopes
- (9) Grout curtain None
- (10) Wave protection Vegetated earth berm
- (11) Drains None
- h. Diversion Channel and Regulating Tunnel. None

i. Spillway.

- (1) Principal
 - (a) Type Uncontrolled drop inlet with a 30-inch diameter corrugated metal pipe riser and a 24-inch diameter corrugated metal pipe conduit.
 - (b) Crest (invert) elevation 56.0 Outlet - 34.0
 - (c) Length 124 feet
- (2) Emergency
 - (a) Type vegetated earth, uncontrolled cut through the left abutment. Bottom width - 40 feet; side slopes - IV on 3H; exit channel slope - 0.065 ft./ft.
 - (b) Control section A level section 30 ft. long near the centerline of the dam.
 - (c) Crest elevation 58.3
 - (d) Upstream Channel Open and clear
 - (e) Downstream Channel Vegetated, slope 0.065 ft./ft., discharging about 200 feet downstream from the dam.
- j. Regulating Outlets. None

SECTION 2 - ENGINEERING DATA

2.1 DESIGN

This structure was designed by the Soil Conservation Service, Columbia, Missouri. Copies of the Geologic and Soil Mechanics Reports are included in Appendix E. The plans are included in Appendix C.

2.2 CONSTRUCTION

The dam was constructed in 1975. The SCS provided technical supervision and quality control for the construction.

2.3 OPERATION

No data were available on spillway operation. It was reported by Mr. Wesley Lee that the emergency spillway has never operated.

2.4 EVALUATION

- a. Availability. The data in Appendix C and Appendix E were readily available from the S.C.S.
- b. Adequacy. The design reports, plans, field surveys and visual observation presented herein are considered adequate to support the conclusions of this report. Seepage and stability analyses comparable to the requirements of the "Recommended Guidelines for Safety Inspection of Dams" presented in the SCS report in Appendix E are considered adequate.
- c. Validity. The data and analyses are considered valid and adequate.

SECTION 3 - VISUAL INSPECTION

3.1 FINDINGS

a. General. A visual inspection of the Grindstone-Lost-Muddy Creek Dam F-20 was made on June 30, 1980. Engineers from Hoskins-Western-Sonderegger, Inc., Lincoln, Nebraska making the inspection were: Rey S. Decker, Geotechnical; Garold Ulmer and Gordon Jamison, Hydrology and Hydraulics. Mr. Wesley Lee accompanied the inspection team.

b. Dam.

- (1) Geology and Soils (Abutment and Embankment). This site is located in the Iowa-Missouri Heavy Till Plains area. Abutments consist of stiff clay till (Kansan) CL-CH. The alluvial valley material consists of stiff silty clay (CL) underlain at shallow depths by siltstone, shale and/or limestone bedrock. Bedrock is exposed in the scour hole at the end of the pipe spillway. Materials in the dam consist of CL-CH material borrowed from the reservoir area and upstream abutments.
- (2) Upstream Slope. The upstream slope is well vegetated with grass and cattails along the waterline. No slumps or slides were observed, nor was there any erosion. Photo No. 2 shows the upstream slope.
- (3) Crest. The crest is well vegetated with adapted grasses. Measurements show the crest elevations to be very uniform and according to the plans. No slumps or deformations were observed. A number of drying cracks, up to 1/4 inch wide, were observed on the crest, as shown in Photo No. 11. The same cracking pattern was observed in the emergency spillway which is cut through natural material. The crest is shown in Photo No. 3 and Plate C-10 of Appendix C.
- (4) Downstream Slope. The downstream slope is well vegetated with adapted grasses. No cracks, slumps or deformations were observed on the slope. Measurements indicate that it was constructed according to the plans. Evidence of an old seep area (dead cattails) was observed downstream from centerline station 6+50. Borings in this area showed no free water to depths of 2 feet. Another seep area occurs downstream from centerline station 5+00 to 6+00. Free water was ponded in this area with no observable flow. Both of these seep areas occur on the berm. Another seep area is located downstream from the berm at about centerline station 5+50. Mr. Lee reported that this seep (spring) was there when the dam was constructed and results

from seepage through the bedrock. Photo No. 4 shows the downstream slope. Photos 12 and 13 show the seeps on the berm.

c. Appurtenant Structures.

- (1) The principal spillway is uncontrolled and consists of a 30-inch corrugated metal pipe riser shown in Photo No. 8 and a 24-inch corrugated metal pipe conduit shown in Photos 14 and 15. The pipe appears to be in good condition. Cattails and grass block part of the entrance to the riser. Cathodic protection measures were installed on the pipe conduit. The activity of the protective measures is monitored by SCS through the "test station" shown on the plans.
- (2) The emergency spillway is an uncontrolled earth channel cut through the left abutment. The spillway is very well vegetated. No slumps or slides were observed in the spillway. There was no evidence of flow through the spillway and no erosion was evident (except for vehicular tracks). Drying cracks similar to those on the crest of the dam were observed in the natural soil in the spillway bottom. Photos 5 and 6 show the spillway.
- (3) Drawdown Facility. The drawdown facility consists of an 8-inch corrugated metal pipe into the 30-inch corrugated metal pipe riser located 4 feet below the crest of the riser.
- d. Reservoir Area. The area around the reservoir is well grassed. No slumps or slides were observed. No significant erosion was evident around the shoreline. Photo No. 9 shows a portion of the reservoir.
- e. <u>Downstream Channel</u>. The channel downstream from the principal spillway appears to be stable (rock is exposed in the plunge pool). A number of willows are growing in the downstream channel.

3.2 EVALUATION

This dam appears to be in good shape with no serious deficiencies nor potential of failure. Measurements indicate that it was constructed in accordance with the plans. Seepage along the downstream slope does not appear to adversely affect the integrity of the structure. Some minor deficiencies in maintenance (heavy growth of cattails around the entrance to the principal spillway, trees in the outlet channel) should be corrected.

SECTION 4 - OPERATIONAL PROCEDURES

4.1 PROCEDURES

There are no controlled outlet works for this dam except the small drawdown pipe. The pool level is controlled by rainfall, infiltration, evaporation, and the capacity of the uncontrolled spillways.

4.2 MAINTENANCE OF DAM

Maintenance appears to be reasonably good. Vegetative growth around the inlet of the principal spillway and in the outlet channel should be controlled.

4.3 MAINTENANCE OF OPERATING FACILITIES

No operating facilities exist at this dam.

4.4 DESCRIPTION OF ANY WARNING SYSTEM IN EFFECT

There is no warning system in effect for this dam.

4.5 EVALUATION

The maintenance of the dam appears to be good with the exception of the vegetation which has been allowed to grow around the principal spillway inlet and the uncontrolled growth of willow trees in the principal spillway outlet channel.

SECTION 5 - HYDRAULIC/HYDROLOGIC

5.1 EVALUATION OF FEATURES

- a. Design Data. "As built" plans for this dam were furnished by the Soil Conservation Service and are shown in Appendix C. Pertinent hydraulic and hydrologic data used in evaluating the dam are shown in Appendix C, Plate C-9.
- b. Experience Data. The drainage area, reservoir surface area, and elevation-storage data were developed from the SCS plans. The hydraulic computations for the spillway and dam overtopping discharge ratings were based on data collected in the field at the time of the field inspection and information taken from the "as built" plans.

c. Visual Observations.

- (1) The drop inlet pipe, trash rack, and anti-vortex plate appear in excellent condition. However, entrance conditions to the riser are becoming blocked with heavy grass and cattails. The outlet end of the pipe was also in excellent condition.
- (2) The emergency spillway is very well vegetated with adapted grasses. There is no indication that the emergency spillway has ever operated.
- d. Overtopping Potential. The spillways are too small to pass 50% of the probable maximum flood without overtopping. The spillways will pass the 1% probability flood as well as 24% of the probable maximum flood without overtopping the dam. Overtopping is dangerous because the flow of water over the crest will erode the face of the dam and, if continued long enough, will breach the dam with sudden release of all of the impounded water into the downstream floodplain.

The results of the routings through the dam are tabulated in regards to the following conditions:

Frequency	Inflow Discharge c.f.s.	Outflow Discharge c.f.s.	Maximum Pool Elevation	*Maximum Depth Over Dam Feet	Duration Over Top Hours
1 %	800	150	59.4	0	
1/2 PMF	1410	1270	60.9	0.7	2
PMF	2820	2780	61.4	1.2	5
0.2+ PMF	690	310	60.2	0	

^{*} Minimum top of dam elevation - 60.2

According to the recommended guidelines from the Department of the Army, Office of the Chief of Engineers, this dam is classified as having a high hazard rating and a small size. Therefore, the 1/2 PMF to PMF is the test for the adequacy of the dam and its spillway.

The estimated damage zone is described in paragraph 1.2 d in this report.

SECTION 6 - STRUCTURAL STABILITY

6.1 EVALUATION OF STRUCTURAL STABILITY

- a. Visual Observation. Measurements indicate that the dam was constructed according to the plans. It is considered to be structurally stable. Stability analyses provided by the SCS show adequate safety factors with phreatic surface developed from emergency spillway elevation and no downstream drainage measures. Therefore, seepage observed in the lower section of the downstream slope should not endanger the safety of the dam from the standpoint of strength. The nature of materials in the dam and foundation indicate that seepage at the toe would not endanger the stability of the dam from the standpoint of internal erosion and piping.
- b. <u>Design and Construction Data</u>. Design data and "As Built" plans were available from the Soil Conservation Service and are included as Appendix C and Appendix E of this report. Seepage and stability analyses presented in the SCS reports are considered adequate for this structure.
- c. Operating Records. There are no controlled operating facilities for this dam.
- d. <u>Post Construction Changes</u>. There have been no post construction changes for this structure.
- e. <u>Seismic Stability</u>. This dam is located in Seismic Zone 1, an earthquake of the magnitude predicted in this area is not expected to cause structural failure of this dam.

SECTION 7 - ASSESSMENT/REMEDIAL MEASURES

7.1 DAM ASSESSMENT

- Safety. The dam appears to be in excellent structural condition with little likely potential of failure. The flood from one-half the Probable Maximum Flood will overtop the dam by 0.7 feet for a period of 2+ hours. Overtopping is dangerous because the flow of water over the crest will erode the face of the dam and, if continued long enough, will breach the dam with sudden release of all of the impounded water into the downstream floodplain. The few minor deficiencies in maintenance should not seriously affect the safety of the structure.
- b. Adequacy of Information. The design data and the "As Built" plans furnished by the SCS and included as Appendix C and Appendix E of this report and the visual observations made during the inspection are considered adequate to support the conclusions and recommendations presented in this report. Seepage and stability analyses presented in the SCS reports are considered adequate for this structure.
- c. <u>Urgency</u>. There does not appear to be an immediate urgency to accomplish the remedial measure recommended in paragraph 7.2a.
- d. Necessity for Further Investigations. Prior to any action being taken on the remedial measure recommended in paragraph 7.2a, the owner should conduct a breach routing of the dam to determine the downstream effects of the failure of the dam.
- e. <u>Seismic Stability</u>. This dam is located in Seismic Zone 1. An earthquake of this magnitude is not expected to be hazardous to this dam.

7.2 REMEDIAL MEASURES

The following remedial measures and maintenance procedures are recommended. All remedial measures should be performed under the guidance of a professional engineer experienced in the design and construction of dams.

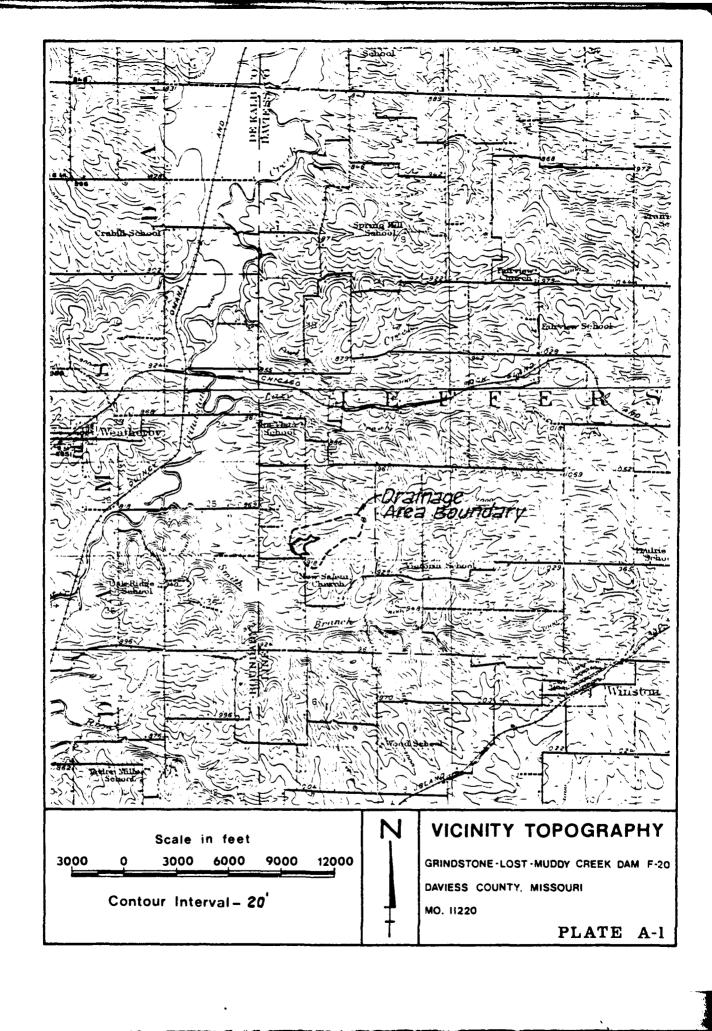

a. Alternatives.

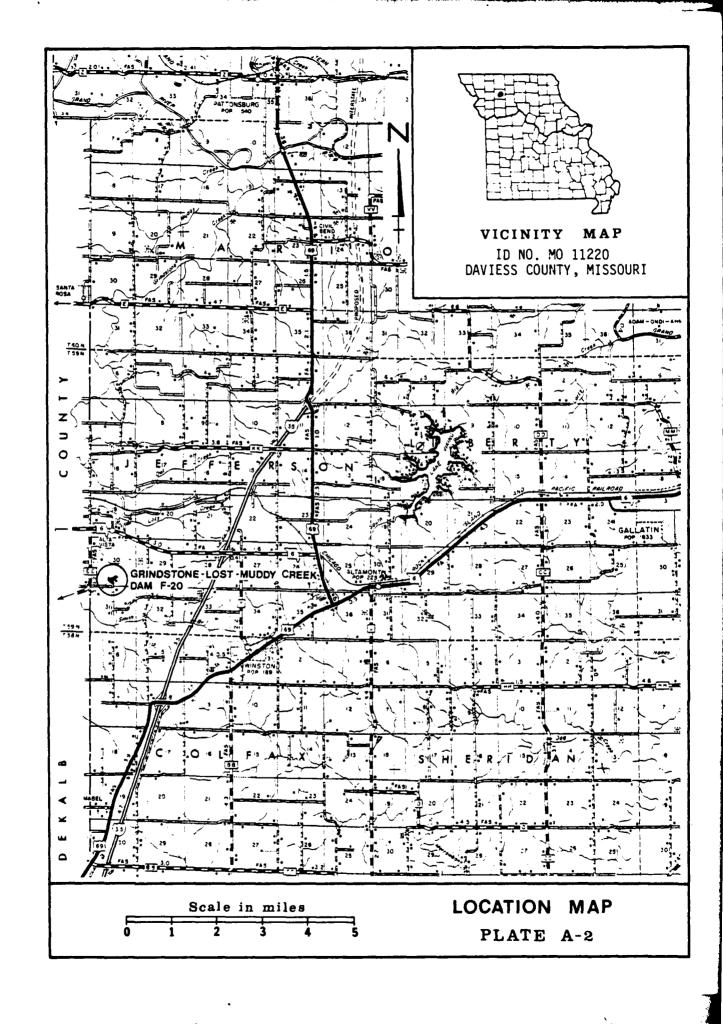

(1) The emergency spillway size and/or the height of dam should be increased to pass 50% of the Probable Maximum Flood without overtopping.

b. Operating and Maintenance Procedures.

- (1) The vegetative growth around the principal spillway entrance should be removed and the area should be kept clear to prevent a reduction in the principal spillway capacity.
- (2) The willows in the principal spillway outlet channel should be removed and measures taken to prevent their recurrence.
- (3) The dam should be inspected at regular intervals and records of the inspections made a part of the project file on this dam.

APPENDIX D
HYDRAULIC AND HYDROLOGIC DATA

HYDROLOGIC COMPUTATIONS

- 1. The SCS dimensionless unit hydrograph and the systemized computer program HEC-1 (Dam Safety Version), July 1978, prepared by the Hydrologic Engineering Center, U.S. Corps of Engineers, Davis, California, were used to develop the inflow hydrographs (See this Appendix).
 - a. Twenty-four hour, one percent probabilistic rainfall for the dam location was taken from the data for the rainfall station at Chillicothe, MO. as supplied by the St. Louis District, Corps of Engineers per their letter dated 4 March 1980. The twenty-four hour probable maximum precipitation was taken from the curves of Hydrometeorological Report No. 33 and current Corps of Engineers and St. Louis policy and guidance for hydraulics and hydrology. The rainfall distribution is inherent in the HEC-1 (Dam Safety Version) computer program and is distributed according to EM 1110-2-1411 (See Section 4a).
 - b. Drainage area = 0.253 square miles (162.0 acres).
 - c. Time of concentration of runoff = 15 minutes (taken from the SCS "as-built" plans, and compared to 18 minutes as computed by the Kirpich formula).
 - d. The antecedent storm conditions for the probable maximum precipitation were heavy rainfall and low temperatures which occurred on the previous 5 days (SCS AMC III). The antecedent storm conditions for the one percent probabilistic precipitation were an average of the conditions which have preceded the occurrence of the maximum annual flood on numerous watersheds (SCS AMC II). The initial pool elevation was assumed at the invert of the principal spillway.
 - e. The total twenty-four hour storm duration losses for the one percent probabilistic storm were 2.33 inches. The total losses for the PMF storm were 1.16 inches. These data are based on SCS runoff curve No. 80 and No. 91 for antecedent moisture conditions SCS AMC II and AMC III respectively. The watershed is composed of primarily SCS soil groups C and D (Lamoni-Shelby-Zook soil association) with approximately 75% in grass and woods and the remainder under cultivation in legumes. Almost the entire watershed is contoured.
 - f. Average soil loss rates = 0.05 inch per hour approximately (For PMF storm, AMC III).
- 2. The combined discharge rating consisted of three components: the flow through the principal spillway, the flow through the emergency spillway and the flow going over the top of the dam.
 - a. The principal spillway rating was developed by using the weir, orifice and full conduit flow equations.

- (1) Weir Flow equation (Q = CLH^{1.5})
 where C = weir coefficient = 3.4 (from USGS TWRI, Bk. 3, Ch. A5)
 L = effective weir length, ft. = 7.8
 H = total head, ft.
- (2) Orifice equation Q = CA √2gh
 where C = orifice coefficient = 0.6
 A = area of riser, sq. ft. = 4.9
 h = total head, ft.
- (3) Full conduit flow equation

$$Q = a \sqrt{\frac{2gH}{1 + Kr + K_pL}}$$

where a = cross-sectional area of pipe, ft² = 3.14

H = total head, ft.

K_r = coefficient for riser = 1.0

K_p = coefficient for pipe friction loss = 0.0459

(ES-42, SCS NEH, Section 5)

L = length of pipe, ft. = 131 (field measurement)

- b. The emergency spillway rating curve was developed using the Corps of Engineers, Water Surface Profile HEC-2 computer program. The slope-area method was used assuming an estimated energy slope of 0.033 ft/ft.
- c. The flows over the dam were determined by using the dam overtopping analyses (irregular top of dam) within the HEC-1 (Dam Safety Version) program.
- 3. Floods were routed through the reservoir using the HEC-1 (Dam Safety Version) program to determine the capabilities of the spillway and dam embankment crest. The input, output and plotted hydrographs are attached in this Section.

INTERPRETATIONS AND CONCLUSIONS

No unfavorable geologic conditions were encountered at this site. The emergency spillway outs will be in the till soil and was not investigated. Borrow areas 101 & 102 are till. Depth of borrow may be limited on the lower slopes in area 102 because of the water level. Borrow area 103 is alluvium with soil profile development and classified CL below the topsoil. The edannels are narrow and shallow and the shallow channel deposite are subject to seasonal change. Limestone colbles occur in the channel downstram from sections D& 5.

Estimated culyds of compacted fill available below the crest stoution of the principal is Grid D.

Borrow aren 101 2000 injudes 102 7000 injudes 103 16000 injudes

DIVISION II

SOILS REPORT USDA-SCS APRIL, 1968 UNITED STATES COVERNMENT

Memorandum

U. S. DEPARTMENT OF AGRICULTURE SOIL CONSERVATION SERVICE

TO : James M. Dale, State Conservation Engineer,

DATE: April 8, 1969

SCS, Columbia, Missouri

FROM : Lorn P. Dunnigan, Head, Soil Mechanics Laboratory, SCS, Lincoln, Nebraska

SUBJECT: ENG 22-5, Missouri WP-08, Grindstone-Lost-Mundy Creek, Site No. F-20 (Devies County)

ATTACHNENTS

1. Form SCS-354, Soil Mechanics Laboratory Data, 1 sheet.

2. Form SCS-355A, Triaxial Shear Test Data, 1 sheet.

3. Form SC3-352, Compaction and Penetration Resistance, 2 sheets.

4. Form SCS-357, Summary - Slope Stability Analysis, 3 sheets.

DISCUSSION

FOULDATION

- A. Bedrock: The bedrock at the site consists of shale and siltstone with some interbedied thin beds of limestone at shallow depths. The bedrock is reportedly of Pennsylvatian age.
- B. Soil Classification: The sample from TH 301 is classified as CL material with a liquid limit of 39 and a PI of 20. Both abutments are logged as CL till.
- C. Shear Strength: Undisturbed samples were not submitted from this site. A plow count of 7 from the 7 to 5-foot depth in The 301 was recorded; and based upon this blow sount, design strength parameters of $\emptyset = 10.5^{\circ}$, c = 1150 pcf are subjected. These strength parameters are from site No. D-34 on this watershed.

EMPAURGENT MATERIALS

10.17

- A. Classification: The horrow samples submitted are from the upstream borrow area (TM's 102 and 103). Inth materials are CL's with liquid limits of 40 (Sample 69WIJO1) and JP (Sample 69WIJO2). The samples have PI's of 22 and 20, respectively.
- B. Compacted Dissiby: Standard Prostor compaction tests were made. Sample typical (Field No. 102.1) has a maximum bry ensity of 109.5 per and Cample 6987302 (Field No. 103.1) has a maximum dry density of 107.0.

- 2 -- James M. Dale -- 4/8/69 Lorn P. Dunnigan Subj: ENG 22-5, Missouri WP-08, Grindstone-Lost-Muldy Creek, Site F-20
- C. Shear Strength: A consolidated unlrained shear test was made on Sample 69W1301 (Field No. 102.1) compacted to average density of 101.5 pcf, which is 92.6 percent of standard Proctor. The test is interpreted to yield shear strength parameters of $\emptyset = 5.5^{\circ}$, c = 625 psf. Sample 69W65, from Site No. B-36 Grindstone-Lost-Muddy, which closely approximates the alluvial materials on this site (F-20) has strength parameters of $\emptyset = 6.5^{\circ}$, c = 625 psf.

SLOPE STABILITY

A. Maximum Section at Station 7+87. A 27.3-foot high embankment was analyzed considering drying cracks to the phreatic surface in all the modified Swedish circle method trials. In addition, the upstream analysis considers rapid drawdown from the emergency spillway elevation to the base of the embankment, no berm, and embankment shear strength parameters of $\emptyset = 5.5^{\circ}$, c = 625 psf. Under these conditions a minimum factor of safety of 1.69 was computed. The upstream analysis considered 2 1/2:1 embankment slopes.

The downstream stability analysis considerations are identical to the upstream with the exception that a full phreatic surface (no irain) is considered in place of rapid drawlown. A factor of safety of 1.76 was obtained for the downstream 2.1/2:1 slope.

B. Floodplain Section at Station 6+50. A 19.3-foot upstream embankment was analyzed considering an 11-foot depth of compressible foundation material. Factors of safety above 3.0 were obtained for this analysis and are fully described on the attached Summary - Slope Stability Analysis, Grinistone-Lost-Muddy Site No. F-20.

RECOMMENDATIONS

- A. <u>Cutoff Trench</u>: We concur with the engineer's recommended cutoff trench depths. The cutoff trench will bottom in CL till and CL alluvium in the abutments, left channel section, and the floodplain. The trench will bottom in bedrock in the right channel section.
- B. Principal Spillway: At the proposed location the foundation consists of about 10 feet of 7-blow-count material overlying bedrock. Pasel on blow count, foundation consolidation is expected to be low for the proposed fill height.
- C. <u>Drain</u>: The trench will bottom in stiff to medium CL (n = 7) and good cutoff is anticipatel with the cutoff trench lepths recommended in the entineer's report for this site, and a drain is not considered necessary.

3 -- James M. Dale -- 4/8/69

Lorn P. Dunnigan

Subj: ENG 22-5, Missouri WP-08, Grindstone-Lost-Muldy Creek, Site F-20

D. Embankment Design:

1. Placement of Materials: The borrow samples submitted have about the same liquid limits. We concur with the engineer's recommendation that the higher plasticity materials be utilized in the interior portions of the embankment fill and the less plastic materials be utilized as a blanket to reduce the possibility of drying cracks and promote vegetative cover.

All materials should be placed at a minimum of 90 percent of standard Proctor density with moisture controlled near optimum.

- 2. Slopes: With the embankment at 90 percent of Proctor and no drain, the proposed 2 1/2:1 slopes are expected to be stable.
- 3. Settlement: An overfill allowance of 0.5 foot is suggested to compensate for residual consolidation within the foundation and embankment.

DATE 0.8! DTIC

Engineer's Report - Investigation of Dam Site F-20 Grindstone-Lost-Muddy Creek

Harold B. Townsend Jr.

12-18-68

Stream channel cleanout is recommended between sections A and B. Cleanout depths of 2.5 ft. to 3 ft., bettom width of 10 ft. and side sleeps of 2:1 should be adequate to remove the recent channel fill. Channel cleanout is not recommended for the channel below the centerline of the dam.

Recommended Core:	Stations	Elevations
	3+00	55.0
	4+00	<u>1</u> 44.∙O
	4+45	32.0
	4+50	32.0
	5+00	38.0
	5+50	33.0
	6+50	36.0
	7+50	36.0
	7+60	31.0
	7+95	31.0
	9+00	50.0
	9+60	56.0
	3:1 End Slow	nes

Placement of the fill materials from the required excevations and borrows will be controlled by the enrincer. The more plastic Ob material to be placed in the core with the IIL or top soil in the outer shell to reduce drying cracks and to improve vegetative cover establishment.

The principal spillway conduit will be 2h inch diameter corrugated metal pine. A pine drop inlet and canbilevered outlet will be used.

Foundation drainage should not be required with the recommended core depths.

There does not appear to be any special foundation or fill design problems at this site.
